Networks

Accelerate performance across an expanding workspace

In a modern business environment, the demands on a corporate network have never been greater. As well as connecting multiple physical sites, today's solutions must integrate a whole range of new technologies and streamline communications across a digital perimeter that's expanding by the day.

Added to these challenges is the urgent need to increase bandwidth for data-intensive activities like video, VOIP and data analytics, while also containing costs.

From planning to ongoing management

experteq has been providing networking solutions to the heavily regulated financial services industry for over 30 years. We'll help you create a solution that connects every aspect of your operations, from data centres through to branches, mobile users and into the cloud.

Through our experience we can provide you with a strategy that clearly demonstrates the value of our solution. Our proven IP will help get you up and running in record time and our optional management services can keep your network operating at peak performance.
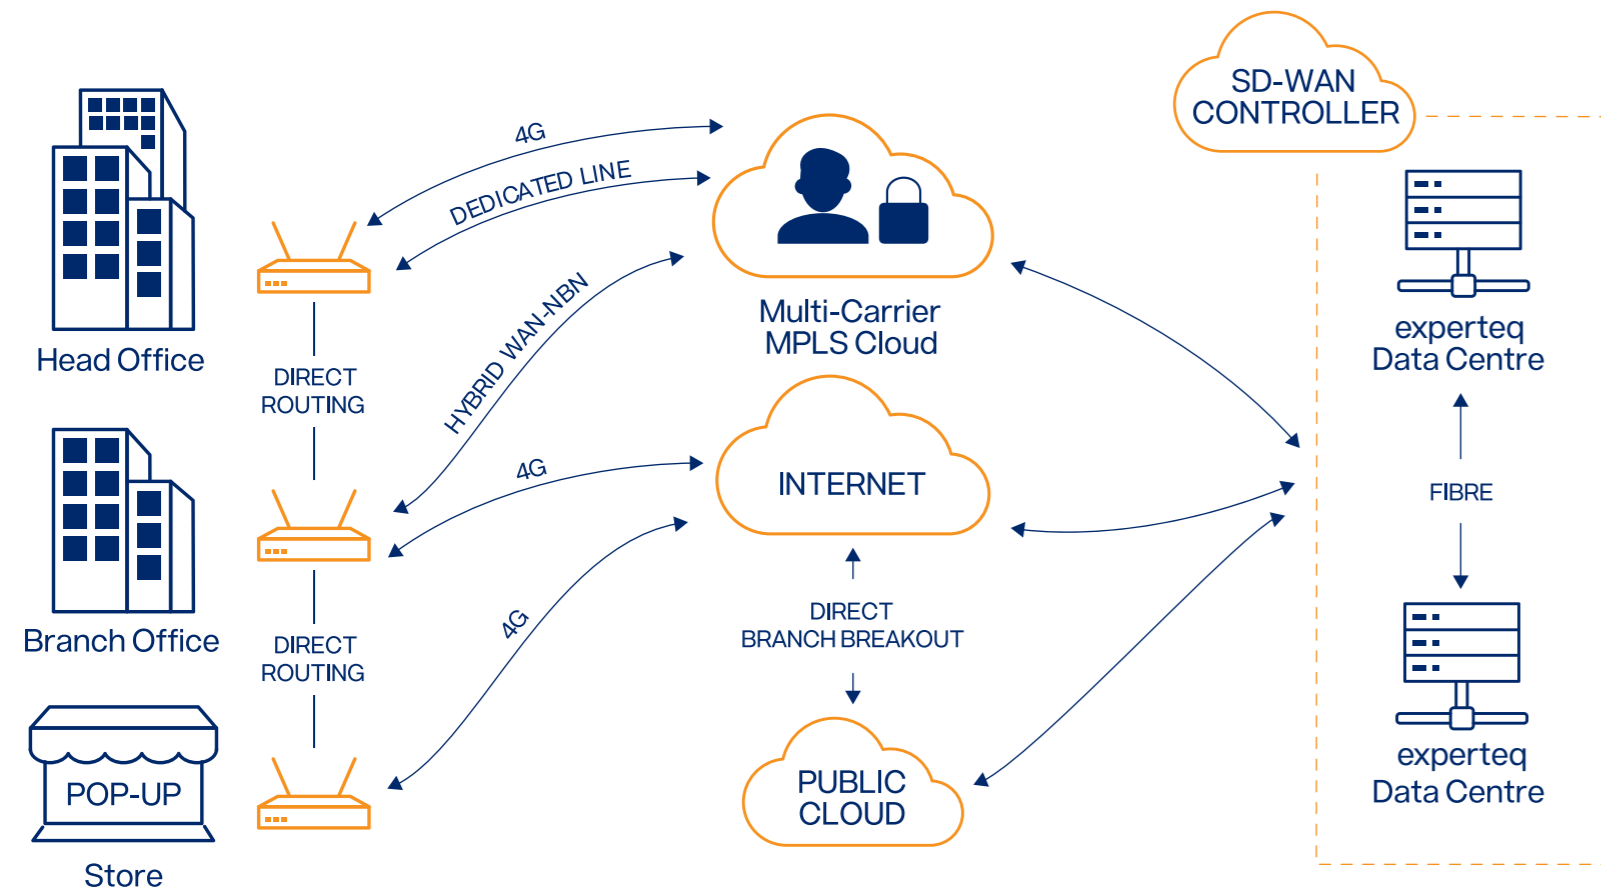

Wrapped in security

By combining multiple layers of defence and implementing policies and controls at key points, experteq will make sure your customers and your business are always protected, no matter where users are located.

experteq network solutions are protected by appropriate security measures to ensure that end-points, branch offices, head office, experteq data centres and the public cloud are all secured.

Increase speed and contain costs with experteq SD-WAN

Built on leading Cisco SD-WAN technology, experteq SD-WAN can dramatically boost your bandwidth by adding cost-effective internet, 4G connections to, or instead of traditional MPLS networks.

Dynamic performance tuning

As a software defined solution experteq SD-WAN reduces performance issues and bottlenecks by automatically determining the fastest route across a network.

Available and secure

An experteq SD-WAN solution increases availability by eliminating single points of network failure. Devices are managed and authenticated through a software-defined interface and security is further enhanced through integrated multi-point security, encryption keys and networking segmentation.

Rapid large-scale implementation

With simple connections to data centres, cloud and SaaS providers, experteq SD-WAN can connect thousands of endpoints and routes across widely dispersed networks.
